To ensure tap water is safe to drink, the United States Environmental Protection Agency (EPA) and the Indiana Department of Environmental Management (IDEM) prescribe regulations to limit the amount of certain contaminants in water provided by public water systems. This publication describes those guidelines for the City of Bloomington’s drinking water. United States Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water, which must provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate the water poses a health risk. More information about contaminants and their potential health effects can be obtained by calling EPA’s Safe Drinking Water Hotline (800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons, such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly people, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA and Center for Disease Control and Prevention (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

**Important Information about Lead in Water:**

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with lead service lines and home plumbing. CBU does not use lead materials but cannot control the variety of materials used in plumbing components of private construction.

When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using the water for drinking and cooking.

If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, test methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline (800-426-4791) or at www.epa.gov/safewater/lead.
Your Drinking Water Source:
The source of the City of Bloomington’s drinking water is surface water from Monroe Reservoir, located nine miles southeast of Bloomington. The City of Bloomington has received a copy of the Indiana-Monroe Reservoir Source Water Assessment. Federal guidelines require the State of Indiana to issue Source Water Assessments in order to identify significant or possible sources of contamination. Information concerning Monroe Reservoir’s Source Water Assessment is available by contacting the City of Bloomington’s Office of Water Quality. CBU participates in the EPA’s Unregulated Contaminant Monitoring Rule program. Contact the Office of Water Quality for more information or copies of results related to this testing program.

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or human activity.

Contaminants that may be present in source water include:
- Microbially transmitted, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, which are byproducts of industrial processes and petroleum production, and can come from gas stations, urban stormwater runoff, and septic systems.
- Radioactive contaminants, which can be naturally occurring or the result of oil and gas production and mining activities.

### 2020 Table of Detected Contaminants

</table>

Listed above are the 12 contaminants detected in Bloomington's drinking water during 2020. All are within allowable limits. Not listed are the more than 65 primary contaminants that were tested for and not detected.

**DEFINITIONS:**
- **90th Percentile** - Ninety percent of samples had lower values than the value indicated.
- **Action Level** - The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.
- **Average** - Regulatory compliance with some MCLs are based on running annual average of monthly samples.
- **Locational Running Annual Average (LRAA)** - The average of the four most recent quarterly samples, for each sample site, collected for reporting purposes.
- **Maximum Contaminant Level (MCL)** - The highest level of a contaminant that is allowed in drinking water. MCLs are set close to the MCLGs as feasible using the best available treatment technology.
- **Maximum Contaminant Level Goal (MCLG)** - The level of contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.
- **Maximum Residual Disinfectant Level (MRLD)** - The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
- **Maximum Residual Disinfectant Level Goal (MRLDG)** - The level of a drinking water disinfectant below which there is no known or expected risk to health. MRLDGs do not reflect the benefits of the use of disinfectants to control microbial contamination.
- **ppb** - Picocuries per liter is a measure of radioactivity in water. A picocurie is 10^-12 curies and is the quantity of radioactive material producing 2.22 nuclear transformations per minute.
- **ppm** - Parts per million. Equivalent to milligrams per liter (mg/l) or one ounce in 7,350 gallons of water.
- **Sources of Contamination** - A required process intended to reduce the level of a contaminant in drinking water.

**ADDITIONAL INFORMATION:**
1. Total Organic Carbon (TOC) removal percentages ranged from 34.3% to 55.3%.
2. Turbidity levels ranged from 0.02 to 0.15 with an average of 0.03 turbidity units. The lowest level of compliance on a monthly basis was 100%.
3. Data listed are from 2015 and are the most recent testing done in accordance with regulations.
4. No sites exceeded the Action Level for either Lead or Copper.
5. Chloramine levels ranged from 0.87 to 3.1 ppm, with an average of 2.35 ppm.
6. Average listed is the greatest LRAA for any sample site during 2020. TTHM levels ranged from 28.9 to 74.0 ppb. Some people who drink water containing trihalomethanes may in excess of the MCL over many years could experience problems with their liver, kidneys, or central nervous systems, and may have increased risk of getting cancer.
7. Average listed is the greatest LRAA for any sample site during 2020. HAAS levels ranged from 20.1 to 57.6 ppb. Some people who drink water containing haloacids in excess of the MCL over many years may have an increased risk of getting cancer.
The City of Bloomington’s Utilities Service Board (USB) meets every other Monday at 5:00 pm. USB meetings are open to the public and citizens are welcome to attend, observe, and record. For more information contact the Director’s Office: (812) 349-3650 or CBUdirector@bloomington.in.gov

THE FACTS ON LEAKS

10 percent of homes have leaks that waste 90 gallons or more per day

A leaky faucet dripping at the rate of one drip per second can waste more than 3,000 gallons per year

Did you know?

Minor water leaks account for nearly 1 trillion gallons of wasted water each year and is equal to annual household water use in nearly 11 million homes

A shower leaking at 10 Drips per minute wastes more than 500 gallons per year

Repair leaks by checking faucet washers and gaskets for wear and replacing them if necessary

Replace old toilets with WaterSense models & save 13,000 gallons of water savings for the average family

Homeowners can save 10 percent on their water bills
